The S enantiomer of I, n=1 or 2, (C6H13 = hexyl) as well as their pharmaceutically acceptable salts, solvates, crystalline forms and prodrugs

synthesized using various solvents and in presence of charcoal-supported palladium catalyst. The utility of these compds. in clin. conditions such as lipid disorders (dyslipidemias) whether or not associated with insulin resistance and therapeutic and other pharmaceutical activities is also investigated. For example, (2S)-3-(4(2-[benzyl(hexyl)amino]-2-oxoethoxy)phenyl]2-ethoxypropinoin acid was prepared in 581 yield via reaction of (2S)-2-ethoxy-3-(4-hydroxyphenyl)propanoate and benzyl bromacettate.

AB Claimed are compns. comprising a polypeptide and an active agent covalently attached to the polypeptide and a method for delivery of an active agent to a patient by administering the composition to the patient.

peptide is a homopolymer of a naturally occurring amino acid or a heteropolymer of two or more naturally occurring amino acids. In an example, (Glu)n-cephalexin was prepared from Glu(OBut)NCA and cephalexin hydrochloride.

E.g., 3-(3,4-dimethoxyphenyl)propionic acid is amidated with Et chloroformate and ammonium hydroxide to give an amide which is reduced with LiAlH#; acylation of the amine with 3,4-dimethoxyphenylacetyl chloride, electrophilic acrom. cyclocondensation of a chloroximie generated from the amide with POCl3 onto the nonacylated arom. ring, and redm. of the imine with NaBM# gives a benzazepine which is coupled to PhCHBFCOOMe and hydrolyzed with aodium hydroxide in water to give the benzazepineacetic acid intermediate II. E.g., coupling of II with 2-gmon animomethylbenzimidazole dihydrochloride mediated by PyBOP and DIFEA in DMF gives I (R1, R4-R6, R8, R9 - HF R2, R3 - MeOF R7 - Ph; R9 - benzimidazol-2-ylmethyl; XY = CH2CH2) (III). By The invention relates to a method for ring chlorination of o-xylene using elemental chlorine in the presence of a Friedel-Crafts-catalyst and a cocatalyst. Wherein benzo-condensed thiazepines or thiazolines are used as cocatalyst. These cocatalysts provide high ratios of 4-chloro- to 3-chloro-1, 3-dimethylbenzene in the products.

AB A method is provided for screening a candidate compound for susceptibility to biliary excretion. The method includes providing a culture of hepatocytes, the culture having at least one bile canaliculus; exposing a candidate compound to the culture; and determining an amount of candidate compound in the at least one bile canaliculus, the amount of candidate compound in the

least one bile canaliculus indicating the susceptibility of the candidate compound to biliary excretion. Optionally, the culture of hepatocytes is a long-term culture in a sandwich configuration. The method is particularly applicable to the screening of multiple candidate compds. in a single effort.

ANSWER 39 OF 186 CAPLUS COPYRIGHT 2004 ACS on STN (Continued) 7,8-dihydroxytetrahydroisoquinoline II (R = H) was the sole detectable intermediate in the formation of I. N-Acetylcysteinyldopa reacted likewise with formatlehyde to give the 7,8-dihydroxytetrahydroisoquinoline II (R = Ac). The anomalous regiochem, underlying formation of II (R = H. Ac) was rationalized with the aid of AMI/FM3 calcas, on a model alkylthiocatechol, predicting a higher HOMO-controlled reactivity on the position ortho rather than para to the activating hydroxyl group. The potential of the reported chem, as a convenient synthetic access to the 2,3,4,5-tetrahydro[1,4]benzothazepine ring system is suggested by the efficient conversion of a cysteinylcatechol to III in the presence of formaldehyde.

HPLC evidence is reported demonstrating the occurrence in some human urine samples of a novel catecholic metabolite, (3R,78)-3,7-dicarboxy-10,11-dihydroxy-2,3,4,5,6,7,8,9-octahydropyrido[4,3-g][1,4]benzothiazepine (I). The compound was shown to arise by a double Pictet-Spengler condensation of the urinary melanogen 5-5-cysteinyldopa with formaldehyde, in which regioselective formation of the six-membered ring ortho to the activating hydroxyl group lends assistance to the subsequent closure of the seven-membered 1,4-thiazepine moiety. The relation between biliary excretion in sandwich-cultured rat hepatocytes and in vivo in rats was examined The biliary excretion of seven model substrates in 96-h sandwich-cultured cat hepatocytes was determined by differential cumulative uptake of substrate in the monolayers preincubated in standard buffer (intact bile canaliculi) and Ca2+-free buffer (disrupted bile canaliculi). Biliary excretion in vivo was quantitated in bile duct-cannulated rats. The biliary excretion index of model substrate, equivalent to the percentage of ratained substrate in the canalicular networks, was consistent with the percentage of the dose excreted in bile from in vivo expts. The in vitro biliary clearance of inulin, salicylate, methotrexate, [D-pen2,5]enkephalin, and taurocholate, calculated as the

of the amount excreted into the bile canalicular networks and the area under the incubation medium concentration-time profile (.apprx.0, .apprx.0,

of the amount excreted into the bile canalicular networks and area under the incubation medium concentration-time profile (.appr.A. 0. .appr.A. 0. .11.0, 12.622.2, and 56.216.0 mL/min/kg, resp.), correlated with their intrinsic in vivo biliary clearance (0.04, 0, 17.3, 34.4, and 116.9 mL/min/kg, resp.), r2 = 0.99. The model compound 264994 was not excreted in bile either in vivo or in vitro. The glucuronide conjugate of 2169994, the 0-demethylated metabolice of 264994, was excreted into bile in vitro when 2169994, but not 264994, was incubated with the monolayers? 2169994 glucuronide undergoes extensive biliary excretion after administration of 264994 or 2169994 in vivo. Biliary excretion in long-term sandwich-cultured rat hepatocytes correlates with in vivo biliary excretion. The study of biliary excretion of metabolites in the hepatocyte monolayers requires consideration of the status of metabolic activities.

AB A synthesis of 1,2,3,4-tetrahydroisoquinolines (TIQs) with one and two
methoxy groups at various positions of the benzene ring was achieved via
the intramol. cyclization of N-(aryllmethyl-2-(phenylsulfinyl) ethylanines
using the Pummerer ceaction as a key step. The reaction was carried out
by using trifluoroacetic anhydride (TRA) (method A) or
TFAA-BF3-Et2O (method B). The cyclization to 4-(phenylthio)
1,2,3,4-tetrahydroisoquinolines 4-SPITOs proceeded effectively when the
reaction center at the benzene ring was electronically activated by a
methoxy group. In the ceaction of the sulfoxide having two OMe groups at
ortho- and para-positions a different cyclization reaction leading to a
benzentiazenine was observed, indicating that the high nucleophilicity of
the

benzene ring caused the unexpected reaction prior to the cyclization to the 4-SPhTIQ. The route starting from methoxylated benzaldehydes was proved to provide an efficient and convenient method of TIQ synthesis which should be complementacy to the well known Pictet-Spengler method. 212185-08-5p

(II: RI, RZ = same as above) and followed by hydrolysis. I are reacted with ClCHZCHINHIZ or salt thereof in the presence of base and followed by reduction and cyclization to give thiazepins (III: RI = same as above). III, useful as intermediates in the production of functional materials, drugs and pesticides, are prepared in an industrial manner efficiently and economically. Thus, o-MesCGH4CHO was treated with SOCC12 to give 8% I (RI = H), which was further reacted with CLCH2CH2NH2.HCl in the presence of aqueous NaOH and followed by reduction with NaBH4 to give (RI The presence of magazine (RI (RI )

AB KT-362 (5-[3-[-2(3,4-Dimethoxyphenyl)ethyl]aminopropionyl]-2,3,4,5tetrahydro-1,5-benzothiazepine fumarate) is an intracellular Ca2+
antagonist. The compound obtained by introducing Me groups onto the
nitrogen (R2) of the side chain of KT-362 showed vasoconstrictive
activity. Therefore we synthesized various decive, and examined their
activities. Substitution at position R2 of the side chain resulted in
potent contractile activity, and the optimal alkyl length was two or three
carbons. The potency was further increased by the introduction of a
chloro group at the R1 position of 2,3,4,5-tetrahydro-1,5henzothiazepines. One of the synthesized compds., 8-chloro-5-(N-ethyl-N[2-(3,4-dimethoxyphenyl)ethyl]aminopropionyl)-2,3,4,5-tetrahydro-1,5henzothiazepines. One of the synthesized compds, 8-chloro-5-(N-ethyl-N[2-(3,4-dimethoxyphenyl)ethyl]aminopropionyl)-2,3,4,5-tetrahydro-1,5henzothiazepine fumarate (9b), showed an ECSO value of 3,47 ± 10-8 M
for contraction of rabbit liliac artery. The action of compound 9b was
antibited by a Ca2+ entry blocker, nicarchipine, but not by an
al-adrenoreceptor antagonist, prazosin. In a Ca2-free medium,
tonic constriction induced by 9b disappeared, and only a phasic
constriction was observed. Though this phasic constriction was inhibited by
diphenhydramine, it was not inhibited by prazosin or nicardipine.

The SH-thiazolo[2,3-d][1,5]benzothiazepines I (R1 = Me, Ph, R2 = H, COZEt) have been synthesized by condensation of the 1,5-benzothiazepine-2-thiones II and a-bromoacetaldehyde di-Et acetal followed by treatment with alkali. The structure and stereochem. of the adducts obtained has been established on the basis of spectroscopic data. For compds. I (R1 = Me, Ph, R2 = COZEt) the presence in solution of two conformers has been postulated. An X-ray crystallog. structural study of thiazolobenzothiazepine I (R1 = Me, R2 = COZEt) reveals that only one conformer is present in the solid state, stabilized by the presence of a short S:-o contact (2.59 Å).

Reaction of tricyclic azetidinones I [X = 0, S; R = Me, CHZPh; n = 0, 1] with trifluoroacetic acid led to bicyclic thioesters II. There is evidence for an intermol. reaction and a possible mechanism is discussed. The structure of E- and Z-II [X = S, R = Me, n = 1] was elucidated by different NMR expts. and complete assignments of Hi- and 13C-chemical shifts are given. Reaction of I [X = 0, R = Me, n = 0] with sodium periodate and magnesium monopercoxyphthalate led to the sulfoxide and the sulfoxe, resp. 193143-66-79 193143-68-99 193143-71-49

A series of 3,4-dihydro-ZH-1,4-benzoxazine-8-carboxamide derivs. was synthesized and evaluated for S3 serotonin (5-HT3) receptor antagonistic activities by means of assays of 5-HT3 receptor binding and the ability to antagonize the von Bezold-Jarishch reflex in rats. The target compds. were analogs and derivs. of (5)-M-1-azabicyclo[2.2.2]cot-3-y1-6-chloro-3,4-dihydro-4-methyl-2H-1,4-benzoxazine-8-carboxamide (1). Replacement of the 1,4-benzoxazine ring with a 1,4-benzthiazine ring or seven-membered ring (i.e., 1,5-benzoxepine or 1,5-benzthiazine) resulted in decreased affinity for 5-HT3 receptor. Introduction of substituents at the 2 position of the 1,4-benzoxazine ring increased the antagonistic activities (di-He) > He > dihydro > phenyll. Compds. bearing a 9-methyl-9-azabicyclo[3.3.1]non-3-yl moiety as the basic part of 3,4-dihydro-ZH-1,4-benzoxazine-8-carboxamide derivs. were equipotent to those bearing 1-azabicyclo[2.2.2]cot-3-yl moiety. Broad-chair conformation on the basis of both NMR studies and X-rays anal. In this series, endo-6-chloro-3,4-dihydro-N-(9-methyl-9-azabicyclo[3.3.1]non-3-yl)-2,2-2,4-trimethyl-2H-1,4-benzoxazine-8-carboxamide showed the highest affinity for 5-HT3 receptors (Ki = 0.019 nM), and a long-lasting 5-HT3 receptor antagonistic activity as evidenced by antagonism to the von Bezold-Jacisch reflex in rats. Such a long-lasting 5-HT3 receptor antagonism condition of both two Me groups at the 2 position of the benzoxazine ring and the 9-methyl-9-azabicyclo[3.3.1]non-3-yl moiety, which adopted the boat-chair conformation.

A series of 2,3,4,5-tetrahydro-1,5-benzothiazepine and related compds. were prepared, and the intracellular Ca2+ inhibitory effects were examined using methoxamine- or caffeine-induced contraction of isolated rabbit acteries. Structure-activity relation studies of these compds. are discussed and the results suggest that novel 5-[3-[2-(3,4-dimethoxyphenyl)ethyl]aminopropionyl]-2,3,4,5-tetrahydro-1,5-benzothiazepine fumarate (20d) showed the most potent inhibitory action on the intracellular Ca2+ release.

The synthesis of three series of 1- and 2-substituted imidazo[2,1d][1,5]benzothiazepines is accomplished starting from 1,5-benzothiazepin-4ones. All the synthesized compds, were evaluated for their affinity for
the benzodiazepine receptor, testing their ability to displace
[3H]Flunitrazepan from bovine brain membrane protein. A few of the tested
compds. showed good affinity, in particular 4,5-dihydro-2phenylimidazo[2,1-d][1,5]benzothiazepine (Ki = 43.00 nM). The GABA-ratio
of the active compds. suggests an antagonist or partial agonist activity.
The data obtained allow us to draw some comments on the structure-activity
relationships.

AB Inhibition of the iteal bile acid active transport system, previously shown to be the mechanism underlying the hypocholesterolemic activity of 2164U90 (a benzothiazepine dioxide derivative) in codents, was further characterized in isolated intestinal prepars from 3 species. 2164U90 inhibited Nat-dependent transport of taurocholic acid by Caco-2 cells and by monkey and human ileal brush border membrane vesticles in a concentration-dependent manner, with ICSO values of 7 µM, 5 µM, and 2 µM, resp. In rat lleal brush border membrane vesticles, 2164U90 was a competitive inhibitor of Nat-dependent taurocholic acid uptake, with an estimated Xi of 1.8 µM. In anesthetized rats, 5 µM 2164U90 placed in the isolated distal ileum with 3 mM [3H]taurocholic acid decreased taurocholate isleal uptake, transport into the bile, and transport are by 31-354. The stereospecificity of inhibition by 2164U90 was demonstrated by the relative inactivity of 3 other possible stereoismores in rat ileal sacs and brush border membrane vesicles. 2164U90 did not inhibit Nat-dependent glucose transport by monky jejunal brush border membrane vesicles, indicating that 2164U90 may be specific for the bile acid transporter. These results suggest that 2164U90 did not inhibit transporter. These results suggest that 2164U90 is a potent, selective, stereospecific, competitive inhibitor of the Nat-dependent bile acid transporter. These results suggest that 2164U90 is a potent, selective, stereospecific, competitive inhibitor of the Nat-dependent bile acid transporter in the ileal mucosal cell brush border membrane.

2164U90, [(3R, 5N)-trans-3-butyl-3-ethyl-2,3,4,5-tetrahydro-5-phenyl-1,4benzothiazepine 1,1-dioxide], was a potent inhibitor of the iseal bile
acid active transport system. In vitro, 2164U90 decreased uptake and
active transport of taucocholic acid by rat everted ileal sacs with IC50s
of 4.0 µM and 1.5 µM, resp. In vivo, 2164U90 produced
dose-dependent increase in 23,25-755e-labeled homocholic acid taurine
(SeHCAT) fecal excretion in rats and mice at doses of 3-30 mg/kg and 1-10
mg/kg, resp. In rats, 30 mg/kg 1264U90 was equivalent to 500 mg/kg
cholestyramine. Two days oral administration of 10 mg/kg 2164U90 to rats
decreased the bile concns. of total bile acids 42, orally administred
[3H] taurocholic acid ([3H]TC) 824, and cholesterol 35t. Cholestyramine
(500 mg/kg) had effects similar to 2164U90 on total bile acid and orally
administered [3H]TC concns. but had no effect on bilary cholesterol. The
hypocholesterolemic activity of 2164U90 was determined in cholesterol-cholic
acid-fed rats and cholesterol-cholic acid-coconut oil-fed mice. 2164U90
inhibited the dietary-induced increase in dextran sulfate-precipitable
lipoprotein cholesterol (VLDL + LDL) at doses comparable to doses needed
to increase the fecal excretion of bile acids.

With the exception of II (R = RI = H), their antimicrobial activity was not significant. Reaction of chalcones RCGH4COCH:CHCGH4R1 (R = H, Me; R1 = H, C1, OMe) and o-aminothiophenol gave tetrahydrobenzothiazepines I. The reaction proceeded via intermediacy of benzothiazepines II. O-aminothiophenol catalyzed the reduction of II to I. 78031-25-1P 166273-72-9P

AB The 19F NMR spectra of 2-methyl-4-(p-fluorophenyl)-2,3-dihydro-1,5benzodiazepine, 2-methyl-4-(p-fluorophenyl)-2,3-dihydro-1,5benzodiazepine, and related compds. are reported. The changes of their
8 19F are quite obvious and show linear correlation with their
corresponding 6 13C. The results show that there is a certain
conjugation between the 4-Ph and C:N of 1,5-dihydrobenzodiazepines and
1,5-dihydrobenzothiazepines. This is supported by the UV and IR spectra
data. In the course of experiment, no coupling between 19F and 1H on the
benzo

ring is observed from the 19F NMR spectra.

Several series of triazino[3,4-c]-1,4-benzothiazines and
triazino[3,4-d]-1,5-benzothiazepines were synthesized. Tentative
syntheses performed to obtain SH-as-triazino[3,4-c]-1,4-benzothiazin-1,2diones and 5,6-dhydro-as-triazino[3,4-d]-1,5-benzothiazepin-1,2-diones
gave rise to s-triaziol derivs. Only in one case was the reaction
successful, affording 3,5-dhydro-as-triazino[3,4-c]-1,4-benzothiazin-1,2dione. All the final compds. were tested for their ability to displace
[3H]flunitrazepam from bovine brain membranes.

AB An erythrocyte (RBC) model based on whole blood was used to investigate
the effect of cardiovascular drugs on the uptake of adenosine in vitro.
Fresh whole blood obtained from healthy volunteers was allowed to
equilibrate with various concns. (S-1000 µM) of a tested agent.
(2-3M)-Adenosine was used as a substrate, and the reaction was terminated
after 2 s of incubation at room temperature by rapid addition of a
"Stopping Solution"
which was a mixture of erythro-9-(2-hydroxy-3-nonyl) adenine, dipyridamole,
and EDTA. The mixture was centrifuged (1760 g, 4°C, 10 min), and the
radioactivity of an aliquot of the supernatant was determined by a
scintillation counter. The results showed that dipyridamole was the most
potent agent tested (1C50 - 0.2 µM). Amongst the calcium antagonists
studied, isradipine was most potent, followed by verapamil, clentiazem,
diltiazem, Mx and MB, were more potent than the parent drug. The
antiarchythmic agents, amiodacone and socialol, the two new lipid peroxido.
inhibitors, U-74398F and U-7851FF, and the anxiolytic agent, alprazolam,
were as active as verapamil. The β-receptor antagonist propranolal
and the angiotensin converting enzyme (ACE) inhibitor, enalapril, were
practically inactive. In addition, the model was stereoselective such tha
the S(-)-enantiomer of verapamil was considerably more potent than the
R(+)-antipode, whereas d(+)-sotalol was practically inactive compared to
racemic sotalol.

The title compds. [I, Rl = alkyl, cycloalkyl; R2 = H, halo; R3, R4, R5 = H, alkoxy, halo, amino, alkylamino, etc.; or R3R4 = part of a ring] are prepared via, e.g., reaction of the aminopropionylbenzothiazepines II with R6-X (R6 = alkyl, cycloalkyl; X = halo]. 8-Chloro-2,3,4,5-tetrahydro-1,5-benzothiazepine (preparation given) in CMC13 containing Et3N was treated

3-chloropropionyl chloride, the product was treated with homoveratrylamine in xylene, and the product was treated with formalin in MeOH to give, after treatment with an alc. solution of funaric acid, the title compound 8-chloro-5-[3-[2-3,4-d-dimethoxyphenyl)ethyl]methylamino]propionyl-2,3,4,5-tetrahydro-1,5-benzothiazepine funarate. In an in vitro study this at 2.3 + 10-7 M effected 501 vasoconstriction compared with 40 mM KCl. 150395-08-78

Several benzothiazepine S-oxides including optically active compds., e.g., I (X  $\simeq$  H2, R  $\simeq$  H; CH2CO3Me), were prepared, and a number of them, including

(X=0,R=GH2CO2Me), were submitted to a Pummerer-type reaction. As expected, p-MeO-Ph or thiophenyl groups were introduced at the position next to the sulfur in I (X=0,R=H) to give the coupled products. The reaction of the sulfoxide I (X=0,R=H) to give the coupled products gave the unexpected benzoisothiazolone II. A mechanism involving a nitrene intermediate is proposed for the formation of II. 103693-32-99

Starting from 2,3-dihydro-1,5-benzothiazepin-4-amine (I), tricyclic 1,5-benzothiazepines were obtained. Reaction of I with Et bromopyruvate and Et aminoacetate hydrochloride led to the imidazo[2,1-d][1,5]benzothiazepines II (R = COZEt, RI = H) and II (R = H, RI = OH), resp. The triazolo derivative III was prepared by treatment of I with present the contraction of the cont

The synthesis of a new series of N-2 alkylamino derivs. of 4,5-dihydro-s-triazolo[3,4-d]-1,5-benzothiazepine was accomplished starting from 2,3-dihydro-1,5-benzothiazepin-4(5H)ones and their 2-Me and 2-aryl derivs. All the compds were tested in vitro for their antimicrobial activity, but none of them showed remarkable activity. The tricyclic compds. were converted to the resp. amines, e.g. I, and some were screened for their activity as central nervous system agents in mice and several of them showed interesting activity. All compds. were devoid of analgesic, bactericidal or fungicidal activity. 118971-11-2P 118971-13-4P 144935-04-6P 144935-06-9P 144935-06-9P 144935-09-1P 144935-10-4P 14935-11-5P RL: RCT (Reactant), SPN (Synthetic preparation); PREP (Preparation); RACT

Title compds., e.g. I (R = CH2OH, COR1, CH2O2CR2, CH2CH2R3, Rl = Me, ORt, CH2Cl, etc., R2 = Ph, 3-pyridyl, OCH2Ph, etc., R3 = CO2Me, cyano), were prepared and evaluated as sedatives and muscle relaxants, inhibitors of pinnal reflex, and for their ability to induce ataxia. Thus, acylation of I (R = H) with RICOCI gave I (R = CH2CH2R3). Several compds., I (R = CH2OH, COMe, CO2Ex, CH2CH2CO2Me, 1-piperidinyl, CH2CHRCH2EX5, RAS = 0), had moderate central muscle relaxing activity in 60-80% of the animals, whereas I (R = H) produced this effect in all the animals.

The LiAlH4 reduction of thiochromanone oximes I (R = H, Me, Ph; R1, R2, R4 = H, Me; R3, R5 = H, Me, MeO) gave a mixture of the normal reduction product (primary amine) and the rearrangement product II. The main conclusions to be drawn from the results are as follows: 1) The presence of an electron-releasing group in the 6-position (para to 1-S) of thiochromanone oxime increases the reduction rate. 2) The presence of an

electron-releasing group in the 7-position (para to the hydroximino group) of thiochromanone oxime decreases the rate of the reduction 3) The presence of an electron-releasing group in the benzene ring of thiochromanone oxime increases the rearranged amine, and in the 7-position (para to the hydroximino) especially 4) The presence of a substituent at C-3 decrease

rate of the reaction. 5) The presence of a substituent at C-2 exerts a slight influence of the rate on the reduction 6) The presence of the substituent at C-2 increases the normal reduction product, and the more

substituent at C-2 gives the more normal reduction product. 7) The presence of the substituent at C-3 decreases the normal reduction product, and the

bulky substituent at C-3 gives the more rearranged amine. The mechanism of the reduction is discussed.

Electrophilic substitution of benzothiazepinethiones with bromides gave (alkylthio)dihydrobenzothiazepines I (NI = H, Ph; R2 = SCH2CH:CH2, SCH2Ph, SCH2CO2Et, SCH2CO2Ph, SCH2CO2CGH4Br-4). The reaction of (methylthio)dihydrobenzothiazepines with semicarbazide or thiosemicarbazide gave I (RI = H, Ph; R2 = NENHC(:X)NH2; X = O, S); the latter (X = 0) was converted to aminotriazolobenzothiazepines. The compds were tested for herbicidal or fungicidal and anticonvulsant activity.

Binding of the new benzothiazepine calcium channel blocker TA-3090 (I) was characterized and its specificity for rat myocardial benzothiazepine receptors described. Scatchard plots and nonlinear regression anal. of specific [3HI binding best fit a one-site binding model (Md = 8.8 m). Bmax = 132 fmol/mg protein). Kinetically derived affinity consts. were in close agreement (Md 7.8 m) with those obtained from anal. of equilibrium binding data. In comparison, under identical conditions [3HIdiltiazem exhibited a Kd of 30 mM and Bmax 106 fmol/mg protein. Specific binding was saturable, reversible and stereoselective (d-cis-1 Ki = 14 mM l-cis-I Ki = 2700 mM). Competitions for [3H] binding were conducted with nifedipine, proprasholo, prazosin, quincidinyl benzilate, verapamil, and yohimbine inhibited specific [3H] binding. Nifedipine could maximally inhibit only 524 of specifically bound [3H] at 10 mM. In contrast, however, 10 mM verapamil completely inhibited specific radioligand binding (Ki = 93 mM) but with six times less efficiency than I. Thus, these data demonstrate that [3H] is a potent radioligand selective for the benzothiazepine binding site and is consistent with the hypothesis that (3H] interacts with a myocardial benzothiazepine receptor site.

AB The conformations of a series of dihydro and tetrahydro 2,4-disubstituted
1,5-benzoheteroazepine have been studied by MMPM and NNDO. The two
boat-like conformations of dihydro compds. arising from the orientations
of 2-substituents toward the boat are calculated to be very close in energy:
the difference is <2 kcal mol-1 and both are therefore stable. This
result has been confirmed by x-ray diffraction. The inversion barrier of
the two conformations is estimated to be 6-7 kcal mol-1 by MMPM for
2,4-di-Me
compds. The conjugation of Ar-N:C-Aris discussed to be the total. di-Me compds. The conjugation of Ar-N:C-Ar is discussed on the basis of the MNDO calcns, and the IMDO localized orbitals. A nonplanar conjugated system has been established. The twist-boat conformation of tetrahydro compds is more stable than the chair conformation, especially for benzothiazepines; this differs from the analogous benzocycloheptanes. 102836-86-2 102836-87-3 NCASS-8-1 10238-8-13 RL: PRP (Properties) (conformation energy of) 102816-86-2 CAFLUS 1,5-Benzothiazepine, 2,3,4,5-tetrahydro-4-methyl-2-phenyl-, trans- (9CI) (CA INDEX NAME)

This coupler-stabilizer combination provides good coloration and especially

fastness and prevention of yellow staining. Thus, polyethylene-coated paper was coated with a Ag(Br,Cl) emulsion containing equimol. amts. of magenta coupler V and stabilizer VI, and with a UV-absorbing layer and a protective layer to obtain a color paper. Sensitemetrically exposed and processed paper produced color image which showed high resistivity to light and moisture and free from yellow stain.

The title compds. (I: Rl = alkyl: R2 = H, alkanoyl: Xl = H, alkyl) were prepared as cardiovascular agents (no data) by alkylation of I (R1 = H: R2 = H, alkanoyl: Xl = H, alkyl, protecting group) followed by deprotection, optional removal of alkanoyl group R2, or salification. Naft (78 mg) was added to a solution of 690 mg (+)-cis-I (R1 = R2 = H, Xl = Me) in THF and

The attempted cyclization of N-(hydroxymethyl)-S-(3,4-dimethoxyphenyl)thioglycolamide with POCl3 gave, instead of the expected benzothiazepinone I (R = MeO, RI = R2 = H) (II), (3,4-dimethoxyphenylthio)acetonitrile. The product of ring closure of N-[[2-(benzoylthio)-4,5-dimethoxyphenyl]methyl]-2-chloroacetamide with NaOBt was II. II can also be prepared in good yield from £T S-[2-(aminomethyl)-4,5-dimethoxyphenyl]thioglycolate in alkaline solution

The thiophenols III (R = H, MeO) reacted with halocarboxylates XCRIR2CO2Et (R1 = H, Me: R2 = H, Me, Ph, CO2Et) in the presence of MaoMe to Turnish the corresponding 4, 5-dihydro-1,4-benzothiazepin-3(2H)-ones I in high yields in one step. LiAlH4 reduction of II gave 2,3,4,5-tetrahydro-7,8-dimethoxy-1,4-benzothiazepin-8.

The title compds. (I; Rl = H, alkanoyl; R2, R3 = alkyl) and their acid addition salts, useful as hypotensive agents, cerebral and coronary vasodilators, and platelet aggregation inhibitors, are prepared Thus, 2-chloro-6-nitrothiophenol and Me trans-3-(4-methoxyphenyl)]cprojonate. which was hydrogenated and cyclized to give (t)-cis-2-(4-methoxyphenyl)]-3-hydroxy-9-chloro-2,3-dihydro-1,5-benzothiazepin-4(5H)-one (II). II was reacted with Me2NCH2CH2Cl-HCl to give (t)-cis-1 (Nl = H, N2 = N3 = Me) (III). The hypotensive activity, cerebral and coronary vasodilating activity, and platelet aggregation-inhibiting activity of III were demonstrated.

AB Separation of positional and cis-trans isomers of tetrahydro-1,5benzothiazepine and tetrahydro-1,5-benzodiazepines was studied using
reversed-phase chromatog. and liquid-solid chromatog. The selection of
separation consisted of C18 columns and MeOH, THF or MeCN in H20 for the
isomers

only but the liquid-solid method was suitable for separation of cis-trans

only but the liquid-solid method was suitable for separation of cis-frame ers
as well as positional isomers using a silica column and Et ether, CHCl3, or Et acetate as the mobile phase.

AB Dihydrobenzothiazepines I (R = H, o-, m-, p-NO2, m-, p-Cl, o-, p-CMe) were prepared by cyclocondensation of RcGH4CH:CHCOMe with o-HZNCGH4SH.

Reduction of I with NaBH4 gave mixts. of trans- and cis-II (approx. 15:1). IR and NMR data showed that the trans-II had a twist boat conformation while the cis-II had a chair conformation.

Thermal ring transformations of 1,4- and 1,5-benzothiazepine 1-oxides I and II (R. R1 = Me. Ph) in the presence of catalytic amount of 4-MeC6H4SO3H were described. trans-Sulfoxides, having the Me group cis to the sulfoxide O, underwent ring expansion to benzothiazocha derivs. whereas the cis isomers afforded ring contraction products, indicating that the ring transformations proceeded stereospecifically.

The fragmentation mechanisms of the benzothiazepines I (R = Rl = Ph; R = Me, Rl = Ph, p-FCGH4, p-MeOCGH4, p-ClCGH4) and II (same R, Rl) under electron impact were studied using high-resolution mass spectrometry, metastable decompns. and D-labeling techniques. Both I and II showed high stability. The (M-SH)+ (M = mol. ion) and the cyclic benzothiazole ions derived from the fragmentation and skeletal rearrangement of the mol. ion were the main spectral features. Some doubly charged ions were observed in 1338-10-8

Benzothiazepinediones I (R = H, Me, Phr R1 = H, 7-Cl, 7-Me, 8-Cl) were obtained by condensing o-aminothiophenols with RCH(COZH)2 in the presence of dicyclohexylcarbodiimide or RCH(COSH)2. Reduction of 4-chromanone oxime by LiAlH4-AlCl3 gave 2,3,4,5-tetrahydro-1,5-benzoxazepine (I): the N-nitroso derivative of I was reduced by Zn-HOAc to yield the N-namino derivative of I which underwent Fischer indole synthesis with MeCOEX cyclohexanone, I-methyl-4-piperidinone, and 4-piperidinone to give the indoles II [X = 0: R = R] = Me: RR1 = (CHZ)4, CHZNMECHZCHZ, resp.). II (X = 5) were prepared similarly.

H The title compds. (I), that are useful tranquilizers and antibacterial agents, are prepared by reacting a sorbic acid RCHZCR2:RCRCCR2:CR2CCQ1 (II) with a 2-minobenzenethiol (III) to give I (RI = H). This is treated in an inect solvent with either a halide or Me2504 in the presence of a base as NaM42 or KOBU to yield I. The CO group in I can be reduced with LiAHH4. Thus, 125.0 g. III (X = H) and 112 g. II (R = R2 = H) in 1.1. MePh and 30 ml. RCOMMe2 was refluxed I hr., 200 ml. Et20 and a solution of layer of

100 ml. concentrated H.I in 300 ml. HAO Was added and the separated original of the filtrate was washed with 10% NAHCO3 to give 30 g. I (R = R] = R2 = X = H), m. 135-7°. This was treated with 4 g. NaNHZ in 400 ml. toluene 30 mln., a solution of 25 g. Me2NCHZCHZBr in toluene was added, stirring 7 hrs. and work up gave 22.5 g. crude I (R = R2 = X = H = N = Me2NCHZCHZ) (Ia); pure oxalate m. 141-3°. Ia (22.0 g.) was refluxed with 5 g. LiAHH4 in 300 ml. dry tetrahydrofuran 8 hrs. to give 19.2 g. hydrogenation product, m. 207-10° (hydrochloride). The following I derivs. (where R = R2 = X = H) were prepared in a similar manner (R1 and phys. data given): ELXCHZCHZ, b0-3 175-80° (citrate m. 55-100°): 4-methyl-1-piperazinylpropyl, b0-2 214-8° (2RC1 salt m. 176-8°); Me, b0-1 147-50°, m.

For diagram(s), see printed CA Issue. The title compds. of the general formula I were prepared by condensing II with COCl2 and treating the formed intermediate III with the corresponding NHRAB. Thus, a mixture of a suspension of 24 g. LialH4 in 950 cc. anhydro tetrahydrofuran and 140 g. 2,3-dihydro-2-phenyl-1,5-benzothiazepin-4-one was stirred 2 hrs. at room temperature, refluxed 3 hrs., cooled, treated dropwise with 40 cc. water and then with a solution of 16 g NaOH in 100 cc. water, and filtered, and the filtrate washed with Et2O, dried, evaporated,

fractionated at 179-81\*/0.2 mm. to give II, m. 65-7\*
(iso-Pr20). A solution of 25.5 g. COCI2 in 300 cc. toluene was added to 44
g. II in 250 cc. CHCl3 at 15\*, the mixture kept overnight, slowly
heated in 3 hrs. to refluxing temperature, and refluxed 1 hr., the solvent
(.apprx.250 cc.) distilled, and the residue (400 cc.) kept several days at
